

Telecare Audio Extender

An additional loudspeaker and microphone for two-way speech with a compatible home telecare alarm. It can support communication from another area of the home.

How it works

The audio extender connects to a compatible base unit and provides an additional point for speaking with the monitoring team. It is an accessory to the alarm system, not a separate alarm or monitoring subscription.

The current TA70 model works with compatible TA7x Carephones. It uses mains power and an Ethernet network connection. Our team will check the practical connection arrangements for your property.

Price and supply

£180 including VAT. One-off equipment purchase. Contact TASK Connect to confirm the current model and supply arrangements before ordering.

A new telecare base unit or monitoring plan is not included. We will explain any additional equipment, fitting or service arrangements your setup requires.

What to check with our team

Tell us the base unit model, where it is installed and which area of the home needs additional audio support. Suitable power and connection points must be available.

A practical two-way speech test should be completed after installation. An audio extender cannot resolve every communication difficulty in every property.

Contact us before ordering. Existing customers should quote their customer number. We will check suitability, compatibility and any programming, fitting or testing required.
